

# M-Track

## Efficiency and flexibility in the greenhouse

The M-Track from Metazet is the ideal solution for optimizing internal logistics in the greenhouse. With this internal transport system, you can connect harvest trolleys, Danish carts, or stackable wagons to a tractor that follows a pre-designated route via an induction wire. Unloading units and pushing units, buffer systems, or disinfection units are among the options. The route can be conveniently programmed on a touchscreen on the tractor itself or on the central control panel.

### Simulation

Want to see how the M-Track could look in your greenhouse? With our advanced drawing technologies, we will bring your transport system to life. We'll produce a simulation showing exactly how the M-Track will work in your business, including any existing or planned routes. Together, we'll work out the best way to utilise your space.

### The benefits of the M-Track system:

- ✓ Custom-made for every specific greenhouse layout
- ✓ Applicable in both existing and new greenhouses
- ✓ Easily combinable with other logistical systems
- ✓ Workflow optimization
- ✓ Cost savings through reduced labor costs and increased efficiency
- ✓ Operable both automatically and manually
- ✓ Easy to install
- ✓ Minimal maintenance requirements

### Strong and safe

The M-Track is a strong truck with solid tyres. It can be operated automatically or manually, and boasts a safety bumper and laser scanners that stop the vehicle immediately when it encounters an obstacle – for maximum reliability and safety.

### Countless options

The M-Track can easily be combined with other logistics systems thanks to its virtually limitless routing options. Unloading units, push-off units, buffer settings or disinfection units are just some of the possibilities. Whatever you grow and whichever system you work with, we have a harvesting trolley to suit your needs.
